

Notes/Questions (To Be Deleted) I

- Still unsure how to tie in PrimeKG paper
- Methods for edge selection/identification? Some instances we only want to preserve structure, but sometimes we want to predict/fit edges, how does that fit into message-passing/GCN methods or other extensions?
- Diffpool article as extension of general GNN, hierarchical pooling over global readout functions?

Graphical Neural Networks

Dominic DiSanto

Department of Biostatistics, Harvard University

December 5, 2023

[Downloadable Slides](#)

Outline

- 1 Set-Up and Motivation 5ish minutes
- 2 General Construction 10-20ish minutes
- 3 Applications and Extensions 20-25ish minutes
 - Multimodal Graph Learning (MGL)
 - Knowledge-Graph Data
 - Structure-Based Drug Design (SBDD)
 - Structure-Induced Pre-Training

Goals

- Provide a useful overview of Graphical Neural Networks (GNN)
 - Motivation for necessity of GNN's
 - Provide a general framework of fitting
- Describe applications and extensions of the general GNN model
 - Multimodal Physiological/Biomedical Data
 - Integration of Knowledge-Graph and EHR Data

KG Application

Image here. Or maybe drop, 4 might be overkill

Multi-modal Biomedical Data

Multimodal knowledge graph
of 17,080 disease phenotypes

Image courtesy of partial figure from McDermott et al. *Structure-inducing pre-training* [11]

Protein Representation

Fig. 2. 3D representations of proteins used for geometric deep learning: (a) 3D grid, (b) 3D surface, and (c) 3D graph, illustrated for PDB ID 2avd.

Fig 2. of Zhang (2023) *Geometric Deep Learning for Structure-Based Drug Design: A Survey* [17]

Motivation

- Want to utilize the input structure of the graph
 - Respect/Maintain
 - Update/Estimate
- "Flattening" graphical data for DNN, CNN, etc. omits useful topology from our data
- Early methods attempting to retain topological info included recursive neural networks and random walk models, which GNN methodology extended [14]

Notation/Set-Up

- Consider the graph $\mathcal{G} = (V, E)$, $E \subseteq V \times V$, where any node v has a related "feature vector" $x_v \in \mathbb{R}^d$
 - Let $N = |V|$
- Let $\mathcal{N}_s(v)$ represent the s -hop neighborhood of any node v (and implicitly $\mathcal{N}(v) \equiv \mathcal{N}_1(v)$)
- Can construct adjacency matrix $\mathbf{A} \in \mathbb{R}^{N \times N}$ to capture structure of edge set E
 - $\mathbf{A}_{ij} = w_{ij} \mathbb{1}\{(i, j) \in E\}$ for scalar weight $w_{ij} \in \mathbb{R}$

Undirected Graph

Directed Graph

[Downloadable Slides](#)

Topology Representations

- Simplest/Naïve method is to use \mathbf{A}
- Consider also the Laplacian matrix $\mathbf{L} = \mathbf{D} - \mathbf{A}$
 - $\mathbf{D} = \text{diag}(\mathbf{A}\mathbf{1}_N)$
- Can use an eigenvalue-normalized Laplacian

$$\tilde{\mathbf{L}} = \mathbf{I} - \mathbf{D}^{-1/2}\mathbf{A}\mathbf{D}^{-1/2} = \mathbf{D}^{-1/2}\mathbf{L}\mathbf{D}^{-1/2}$$
- Note that a given graph topology is represented equivalently by any permutation of its \mathbf{A}

Outline

- 1 Set-Up and Motivation 5ish minutes
- 2 General Construction 10-20ish minutes
- 3 Applications and Extensions 20-25ish minutes
 - Multimodal Graph Learning (MGL)
 - Knowledge-Graph Data

What do we estimate about graph structure?

GNN learning can be

$$\left\{ \begin{array}{l} \text{Node-wise } \Phi(\mathcal{G}, v) : (v \in V) \rightarrow \mathbb{R}^m \\ \text{Edge-wise } \Phi(\mathcal{G}, e) : (e \in E) \rightarrow \mathbb{R}^m \\ \text{Graph-level characteristics } \Phi(\mathcal{G}) \end{array} \right.$$

What do we estimate about graph structure?

GNN learning can be

$$\left\{ \begin{array}{l} \text{Node-wise } \Phi(\mathcal{G}, x) : (x \in V) \rightarrow \mathbb{R}^m \\ \text{Graph-level characteristics } \Phi(\mathcal{G}, e) : (e \in E) \rightarrow \mathbb{R}^m \\ \text{Graph-level characteristics } \Phi(\mathcal{G}) \end{array} \right.$$

General Framework¹

We begin with the general Message Passing Neural Networks (MPNN) structure of a GNN:

```

1: Initialize  $h^{(0)} \leftarrow x_v, \forall v \in V$ 
2: for  $\kappa = 0, \dots, K$  do:
3:   for  $v \in \mathcal{G}$  do:
4:      $m_u^{(\kappa+1)} \leftarrow \text{Message}(h_v^{(\kappa)}, h_u^{(\kappa)}, e_{vu}), \forall u \in \mathcal{N}_v$ 
5:      $h_{agg}^{(\kappa+1)} \leftarrow \text{Aggregate}(\{m_u^{(\kappa)} \mid u \in \mathcal{N}_v\})$ 
6:      $h^{(\kappa+1)} \leftarrow \text{Update}(h^{(\kappa)}, h_{agg}^{(\kappa)})$ 
7:  $\hat{y} \leftarrow \text{Transform}(\{h_v^K \mid v \in \mathcal{G}\})$       or  $\text{Readout}(\cdot)$ 

```

¹See [3, 6, 15]

General Framework

Can succinctly represent the κ th layer as:

$$h_v^{(\kappa+1)} = Up \left\{ h_v^{(\kappa)}, Agg \left[Msg \left(h_v^{(\kappa)}, x_u^{(\kappa)}, e_{u,v}^{(\kappa)} \right) \right] \right\}$$

Choices of (differentiable) functions for Aggregate, Update, and Readout determine the architecture of your GNN

Trained end-to-end via backpropagation for problem-specific Transform function

Aggregate & Update

- **Aggregate**(\cdot) produces a representation of information from a node's neighborhood via **permutation invariant** function
- Can include weights (edge-wise or learned)
- Over later iterations, this includes information from further and further distant nodes to any one target node
- We then **Update**(\cdot) our current state using this aggregated neighborhood-level information

Transform/Readout

- **Transform(\cdot)** translates our learned node representations to some desired outcome
 - Regression
 - Binary/Multi-class classification
 - MLP/DNN's
 - **Readout(\cdot)** is common term for translating node-level output to graph-level
 - *Global Pooling* - Methods applied over entire graph (e.g. averaging, fitting "regular" deep neural network, etc.)

Graph Convolutional Network

- Proposed in 2017 by Thomas Kipf, Max Welling [10], can consider one example of "Laplacian-based methods" [6]

$$\mathbf{H}^{(\kappa+1)} = \text{ReLu} \left(\tilde{\mathbf{D}}^{-1/2} \tilde{\mathbf{A}} \tilde{\mathbf{D}}^{-1/2} \mathbf{H}^{(\kappa)} \Theta \right)$$

- Motivated by considering the graph convolution² $x \star g = U g U^T x$ as the message passing function
- Learned weight/parameter matrix Θ

² U the matrix of eigenvectors of \mathbf{L}

Graph Convolutional Network

Intuitive "derivation":

$$\mathbf{H}^{(\kappa+1)} = \sigma \left(\mathbf{A} \mathbf{H}^{(\kappa)} \Theta \right)$$

$$\mathbf{H}^{(\kappa+1)} = \sigma \left(\mathbf{D}^{-1} \mathbf{A} \mathbf{H}^{(\kappa)} \Theta \right) \quad \text{Normalizing by degree}$$

$$\mathbf{H}^{(\kappa+1)} = \sigma \left(\mathbf{D}^{-1/2} \mathbf{A} \mathbf{D}^{-1/2} \mathbf{H}^{(\kappa)} \Theta \right) \quad \text{Symmetric normalization}$$

$$\mathbf{H}^{(\kappa+1)} = \sigma \left(\tilde{\mathbf{D}}^{-1/2} \tilde{\mathbf{A}} \tilde{\mathbf{D}}^{-1/2} \mathbf{H}^{(\kappa)} \Theta \right) \quad \text{Adding self-loop}$$

where $\tilde{\mathbf{A}} = \mathbf{A} + \mathbf{I}$, $\tilde{\mathbf{D}}_{ii} = \sum_j \tilde{\mathbf{A}}_{ij}$, σ is any activation function, \mathbf{H} is simply the matrix of \mathbf{h}_v for all nodes

Graph Convolutional Network

- Proposed in 2017 by Thomas Kipf, Max Welling [10], can consider one example of "Laplacian-based methods" [6]

$$\mathbf{H}^{(\kappa+1)} = \underbrace{\text{ReLu}}_{\text{Update}} \left(\underbrace{\tilde{\mathbf{D}}^{-1/2} \tilde{\mathbf{A}} \tilde{\mathbf{D}}^{-1/2} \mathbf{H}^{(\kappa)} \Theta}_{\text{Aggregate/Message}} \right)$$

- Motivated by considering the graph convolution³ $x \star g = U g U^T x$ as the message passing function
- Learned weight/parameter matrix Θ

³ U the matrix of eigenvectors of \mathbf{L}

General Framework (Revisited)

• Input

- Node conceptualization
- Node embeddings

• Architecture

- Message Passing Neural Network (MPNN)
- $\mathbf{H}^{(\kappa+1)} = \text{ReLU} \left(\tilde{\mathbf{D}}^{-1/2} \tilde{\mathbf{A}} \tilde{\mathbf{D}}^{-1/2} \mathbf{H}^{(\kappa)} \Theta \right)$

• Output

- Target output (Readout, Transform functions)
- Loss function

Outline

 - Structure-Induced Pre-Training

Multimodal Graph Learning (MGL)

Multimodal Graph Learning (MGL)

- Ektefaie (2023) *Multimodal learning with graphs* [3]
- Cite 14-16 in multimodal paper for multi improvement over uni VAE
- Topology is complicated by multimodality of input data
 - Modal collapse [9]
 - Differential data availability
 - Can mention Kipf algorithm does well in semi-supervised setting (even with limited labels available within a given "cluster"), so if we have some gold standard data (biomarker/strong proxy, etc.) that is difficult to obtain, can be VERY useful to include for MGL and lead to good performance, no bullet point here just mention

Multimodal

Clinical Data

- Clinical text
- -omics data
- Laboratory measurements
- Clinical imaging

Protein Structures

- 1° AA Sequence
- 2° Helix interactions
- 3° Folding, bridges

Framework

Authors propose a four component "blueprint"

- ① Identifying entitites (i.e. modalities)
- ② Uncovering topology
 - *A priori*
 - Adaptively learned
- ③ Propagating information
- ④ Mixing representation

Framework

Authors propose a four component "blueprint"

- ① Identifying entitites (i.e. modalities)
 - ② Uncovering topology
 - ③ **Propagating information**
 - ④ **Mixing representation**
- } Structure Learning
- } Learning On-Structure Phase

Structure Learning

- Consider patients as *nodes*
- Consider modalities as *entities* (colored nodes)
 - Clinical text/narrative data
 - Laboratory/Physiological measurements
 - Image/Video data
 - Patient reported measurements/symptoms
 - etc.

Figure: Subset of Fig 2c [3]

Learning on Structure

Proteins and Structure-Based Drug Design (SBDD)

Structure-Based Drug Design (SBDD)

- Zhang (2023) *Geometric Deep Learning for Structure-Based Drug Design: A Survey* [17]
- SBDD aims to improve drug-discovery by understanding 3D protein structures and predicting drug efficacy/behavior
- Problems of note for GNN's include **binding site prediction** and **binding affinity prediction**

Images from Fig. 1 of Zhang (2023) [17]

Output

- **Binding site prediction** is binary categorization at the (surface) amino acid level
- **Binding affinity prediction** is a continuous measure of protein-ligand interaction strength
- Protein Databank (PDB), PDBeBind, Dockground, CSAR-HiQ are existing data sets used to train most GNN's in these contexts
- Other characteristics are important for drug design and protein-ligand interactions but without current GNN methods to my knowledge
 - Binding pose
 - Ligand generation
 - Linker design

Input

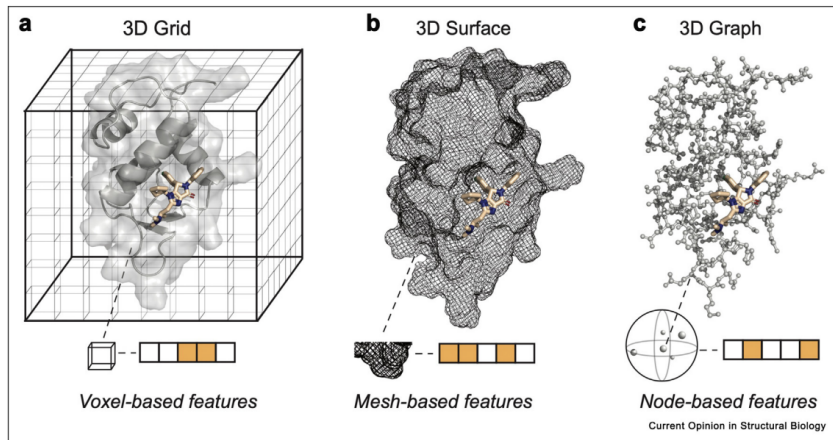

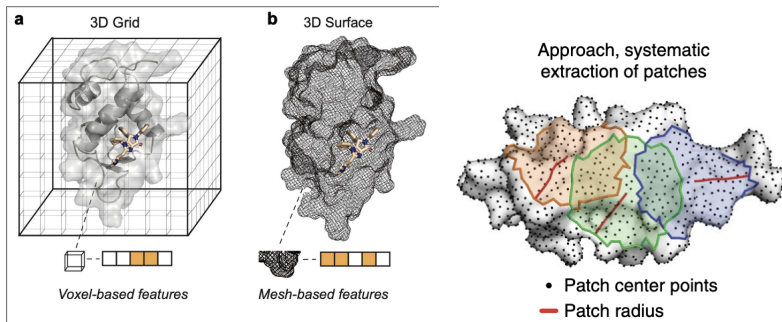

Figure from Iserl (2023) [8]

CNN Input

- Nodes and edges defined by radial patches about a discretization of the protein surface

Left: Fig 2(ab) from Iserl (2023); Right: Fig 1a. Gainza (2020) [8, 5]

GNN Input

- Nodes \mathbf{v} include 3-dimensional coordinate data
 - Atomic structure in Euclidean space
 - Amino acid (also "residue") structure
- Maintain invariance for translations, rotations but not necessarily reflections

Figure: Figure 1c from Isert (2023) [8]

[Downloadable Slides](#)

Architecture

Consider some transformations T, T' (e.g. reflection, rotation, etc.) within the same symmetry group:

Invariance: $f(T(x)) = T'(f(x)) = f(x)$

Equivariance: $\forall T, \exists T' : f(T(x)) = T'(f(x))$

Architecture(s)

Forgoing the iteration supercripts, one message pass can be represented as such:

$$\begin{aligned}
 m_{ij} &= \text{Msg}_m(\mathbf{v}_i, \mathbf{v}_j, h_i, h_j, e_{ij}) \\
 \mathbf{m}_{ij} &= \text{Msg}_m(\mathbf{v}_i, \mathbf{v}_j, h_i, h_j, e_{ij}) \\
 h'_i &= \text{Update}_h \left[h_i, \text{Agg}_h(\{m_{ij}\}_{j \in \mathcal{N}(v_i)}) \right] \\
 \mathbf{v}'_i &= \text{Update}_v \left[\mathbf{v}_i, \text{Agg}_v(\{\mathbf{m}_{ij}\}_{j \in \mathcal{N}(v_i)}) \right]
 \end{aligned}$$

where $\text{Msg}_m, \text{Update}_h$ are geometrically **invariant**, scalar functions and $\text{Msg}_m, \text{Update}_v$ are geometrically **equivariant**, vector functions
 Here $\mathbf{v} \in \mathbb{R}^3$ are 3-D coordinates (e.g. atom or amino acid location)

EDIT Clarify invariatne/equvariant to what transformations

Architecture(s)

May also consider the proposed Equivariant Graphical Neural Network (EGNN) from Satorras (2021) [13]. Again, let \mathbf{v}_i represent a node's coordinate embeddings:

$$\begin{aligned}m_{ij} &= \text{Msg}_m(h_i, h_j, \|\mathbf{v}_i^{(\kappa)} - \mathbf{v}_j^{(\kappa)}\|^2, e_{ij}) \\ \mathbf{v}_i^{(\kappa+1)} &= \mathbf{v}_i^{(\kappa)} + C \sum_{j \neq i} \left(\mathbf{v}_i^{(\kappa)} - \mathbf{v}_j^{(\kappa)} \right) \phi_v(m_{ij}) \\ m_i &= \text{Agg}(m_{ij}) = \sum_{j \neq i} m_{ij} \\ h^{(\kappa+1)} &= \text{Update}(h^{(\kappa+1)}, m_i)\end{aligned}$$

NodeCoder

Figure: Subst of Fig. 1 from Abdollahi (2023) NodeCoder [1]

With a given layer updated using a slight adaptation:

$$\mathbf{H}^{(\kappa+1)} = \text{ELu} \left(\tilde{\mathbf{D}}^{-1/2} \tilde{\mathbf{A}} \tilde{\mathbf{D}}^{-1/2} \mathbf{H}^{(\kappa)} \Theta \right)$$

$$\mathbf{H}^{(K)} = \text{LogSoftMax} \left\{ \tilde{\mathbf{D}}^{-1/2} \tilde{\mathbf{A}} \tilde{\mathbf{D}}^{-1/2} \text{ELu} \left(\tilde{\mathbf{D}}^{-1/2} \tilde{\mathbf{A}} \tilde{\mathbf{D}}^{-1/2} \mathbf{H}^{(\kappa)} \Theta \right) \Theta_t \right\}$$

Implementations

- [PyTorch Geometric](#) with directed extension [PyTorch Geometric Signed Directed](#)
- [TensorFlow GNN](#) [4]
- [GraphNeuralNetworks.jl](#)
- [Spektral](#), Keras-based Python package
- Limited but some implementation in R
 - [scapGNN](#), package GNN implementation but specific/narrow for single-cell -omics data

Abbreviated History

- Graph Neural Network first(?) coined in Gori (2005) [7] and subsequently in Scarselli (2009) *The Graph Neural Network Model* [14]
- Graph Convolutional Network by Kipf (2017) [10] but with similar convolutional message-passing algorithms (within GNN's) proposed in at least 2015 [2]
- Message passing GNN proposed in Gilmer (2017), applications in molecular chemistry [6]

Additional Applications, Interesting Papers I

- Applications in travel time prediction, 2021
(<https://arxiv.org/pdf/2108.11482.pdf>)
- Someone has compiled graph-/GNN-relevant talks for NeurIPS 2023 at https://github.com/XiaoxinHe/neurips2023_learning_on_graphs

DiffPool

Figure 1 from Ying (2018) *Hierarchical Graph Representation Learning with Differentiable Pooling* [16]

Figure 1: High-level illustration of our proposed method DIFFPOOL. At each hierarchical layer, we run a GNN model to obtain embeddings of nodes. We then use these learned embeddings to cluster nodes together and run another GNN layer on this coarsened graph. This whole process is repeated for L layers and we use the final output representation to classify the graph.
